

# Distributed Framework for Gene Finding using Open-MPI

Shenghua Chen

University of Chicago

MPCS 56430 Introduction to Scientific Computing

#### Introduction

## Project Objectives

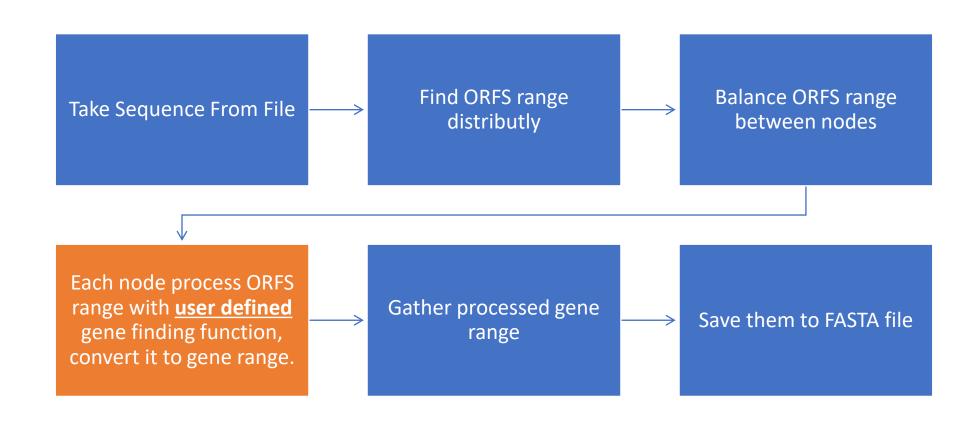

- What is gene?
  - Genes are parts of DNA whose job is to make specific proteins that play a key role in the structure and function of the body.
- What is gene finding?
  - In computational biology, gene prediction or gene finding refers to the process of identifying the regions of genomic DNA that encode genes.
- We need a framework that can help us deploy gene finding job as fast as possible.

```
militor_mod = modifier_ob
  mirror object to mirror
mirror_mod.mirror_object
 peration == "MIRROR_X":
mlrror_mod.use_x = True
mirror_mod.use_y = False
mirror_mod.use_z = False
 _operation == "MIRROR_Y"
irror mod.use x = False
Irror mod.use y = True
 irror mod.use z = False
 operation == "MIRROR_Z"
  rror_mod.use_x = False
 rror_mod.use_y = False
  rror_mod.use_z = True
  melection at the end -add
   ob select= 1
   er ob.select=1
   ntext.scene.objects.actim
  "Selected" + str(modified
   irror ob.select = 0
  bpy.context.selected_ob
lata.objects[one.name].sel
  int("please select exaction
    - OPERATOR CLASSES ----
      mirror to the selected
    ect.mirror_mirror_x
  ext.active_object is not
```

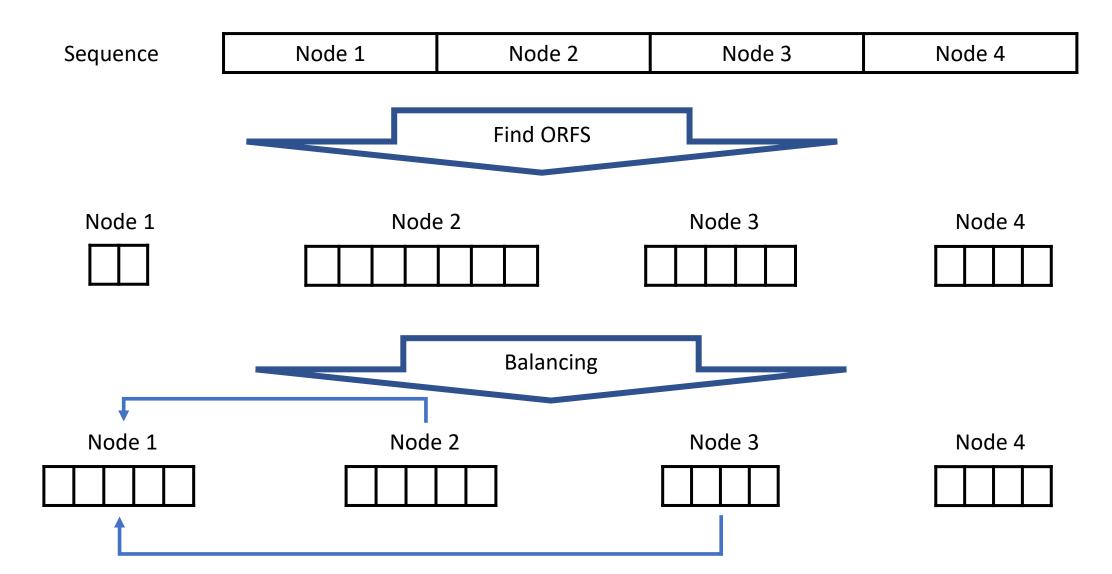

# Background

- There are few gene finding software exist:
  - FINDER (<a href="https://github.com/sagnikbanerjee15/Finder">https://github.com/sagnikbanerjee15/Finder</a>)
  - GeneParser (<a href="http://stormo.wustl.edu/src/GenParser/">http://stormo.wustl.edu/src/GenParser/</a>)
  - mGene (https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2775605/)
  - •
- Those software has limitation:
  - Single algorithm
    - More Flexible
  - Single node
    - Can't run it on cluster

#### My Solution

## My Solution

#### User Defined Function

#### Take:

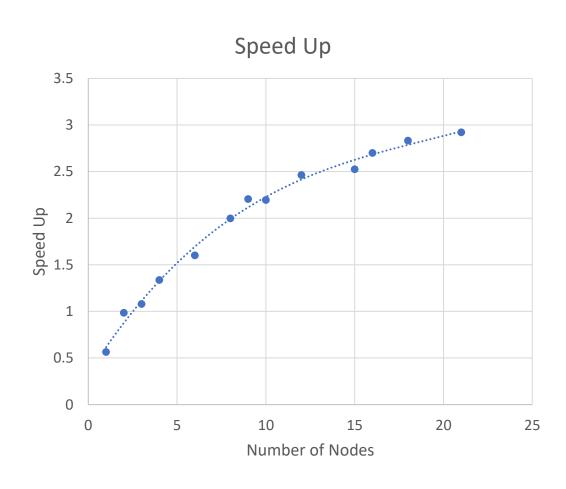

- ORF
  - *GeneRange*[Start,End]
- Sequence

#### Return:

- Not Gene Signal
  - An invalid GeneRange
- Gene
  - GeneRange[AdjustedStart,AdjustedEnd]

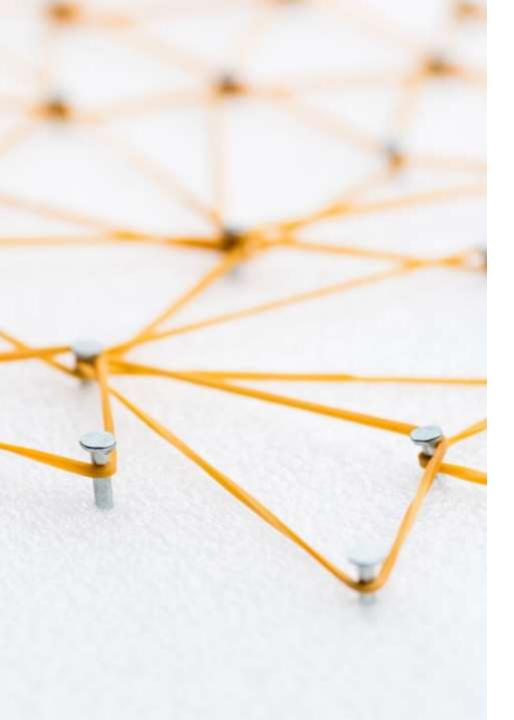

gene::GeneRange isGene(const gene::GeneRange & range, const Sequence & seq);

## Summary - Performance

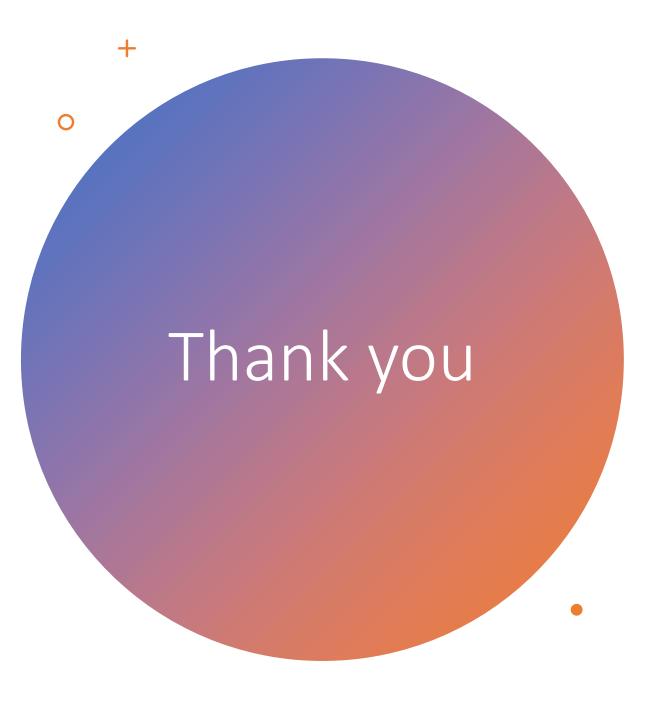

• 
$$Speedup = \frac{T_{single\_node}}{T_{multi\_node}}$$

- Speed up is based on complexity of user defined gene finding function.
  - This step is fully parallizble
- With highly complex gene finding function speed up factor can over 4 when there is 5 nodes.

### Future Work

- Edge Computing
  - Rely on stable connection between nodes
- Heterogeneous computing
  - Balancing are based on assumption: Every nodes has similar computational power.
